SEO / GEO / AEO Audit Report

FULL AUDIT · June 15, 2026

Dimension	Score	Status
SEO	7.2/10	On Track
GEO	5.8/10	Needs Work
AEO	7.0/10	On Track

Codex Skill and Plugin by Alex Labat

Executive Summary

Pretty Toolkit has a clean static foundation and unusually good FAQ coverage for a small brand site. Traditional SEO is on track: crawlability, titles, canonicals, sitemap, app landing pages, and schema are already in place. The largest risks are trust/entity issues for generative engines, especially the mismatch between “no analytics SDKs” marketing copy and Mixpanel disclosures in app privacy policies, plus absent social profile/entity links. The fastest wins are creating the missing Open Graph image, adding real screenshots, aligning privacy language, and expanding app/organization schema.

Dimension	Score	Status	Key takeaway
SEO	7.2/10	On Track	Strong technical foundation, but missing social image, real app media, richer schema, and sitemap metadata.
GEO	5.8/10	Needs Work	Brand entity and trust signals are thin, and privacy/analytics wording is inconsistent.
AEO	7.0/10	On Track	FAQ schema is a real advantage; answer extraction can improve with question-led headings and concise definitions.

Pages Reviewed

Reviewed 11 generated pages from the local production build, plus robots.txt and sitemap output.

Page	Word count	Schema	Note
/	412 words	Organization, WebSite	Good homepage foundation; description is 178 chars and can be tightened.
/about/	521 words	Organization	Useful brand principles; weak author/founder/entity proof.
/luxira/	765 words	Organization, SoftwareApplication, FAQPage	Best AEO page; needs screenshots and richer app schema.
/sincefy/	583 words	Organization, SoftwareApplication,	Good product positioning; more question-led

		FAQPage	headings would help snippets.
/sopora/	519 words	Organization, SoftwareApplication, FAQPage	Coming-soon page should avoid schema implying availability/free offer until live.
/support/	220 words	Organization, FAQPage	Helpful FAQ; could add ContactPage/ContactPoint schema.
/privacy/	305 words	Organization	Thin but adequate; should align analytics wording with app privacy pages.
/terms/	11 words	None	Redirect/canonical to Apple; consider excluding from sitemap.
/app/privacy/	648-791 words	Organization	Solid legal content; useful trust evidence but not discoverability pages.

Top Priorities

P0: Resolve trust-copy inconsistency

Homepage/about/support copy says or implies no analytics SDKs, while app privacy policies mention Mixpanel anonymous analytics. Align claims to “no ads, no tracking, privacy-first anonymous diagnostics/analytics where disclosed.”

P0: Create /og-image.png

Every page references <https://prettytoolkit.com/og-image.png>, but neither public/ nor dist/ contains it. This hurts social previews and can create broken media in AI/browser citations.

P1: Add real screenshots and image metadata

App pages currently render branded placeholders instead of screenshots. Add real app screenshots/WebP picture fallbacks with descriptive alt text and optional image sitemap coverage.

P1: Strengthen entity graph

Fill Organization sameAs once social URLs are live, add ContactPoint, founder/publisher details if acceptable, and link app pages to App Store URLs in schema with sameAs/downloadUrl.

P1: Make AEO sections more answer-shaped

Add “What is Pretty Toolkit?”, “What is Sincefy?”, “How does Luxira work?” style H2/H3 blocks with 40-60 word answers near the top of important pages.

P2: Improve sitemap and canonical handling

Add lastmod entries and consider excluding /terms/ from sitemap because it canonicalizes externally to Apple's Standard EULA.

P2: Add BreadcrumbList schema

Generated app and privacy pages would benefit from breadcrumb schema for clearer hierarchy and richer search interpretation.

P2: Deepen SoftwareApplication schema

Add applicationSubCategory, downloadUrl/installUrl, image, publisher, privacyPolicy, featureList, and App Store aggregateRating only if verified and current.

What Is Working

- Build is static, fast, crawlable, and JavaScript-light.
- Every meaningful generated page has a canonical URL, viewport meta, Open Graph/Twitter tags, and a unique title/description.
- App pages include SoftwareApplication and FAQPage JSON-LD, and support also includes FAQPage schema.
- Robots allows crawling and points to sitemap-index.xml.
- App pages have detailed FAQ answers with good long-tail keyword coverage, especially Luxira.

SEO Findings

Strong

Unique titles, descriptions, canonicals, mobile viewport, robots.txt, and sitemap are present across the site.

Issue

/og-image.png is referenced globally by BaseLayout but is absent from public and dist.

Issue

No committed app screenshots; app pages fall back to visual placeholders, weakening image search, social previews, and conversion.

Issue

Sitemap lists URLs only. It lacks lastmod and image data, and includes /terms/ even though that page canonicalizes to Apple.

Opportunity

Add BreadcrumbList schema and richer SoftwareApplication fields to help crawlers understand the portfolio structure.

GEO Findings

Strong

The site has clear brand/entity naming and a focused category: premium iOS utility apps.

Issue

Organization sameAs is empty, social links are placeholders, and About lacks named ownership/credentials or external corroboration.

Issue

Marketing trust claims conflict with app privacy disclosures about Mixpanel anonymous analytics.

Issue

Few external citations or evidence signals exist beyond legal/privacy links; no press, reviews, awards, App Store rating evidence, or public founder profile.

Opportunity

Use entity-consistent language: Pretty Toolkit, Luxira, Sincefy, and Sopora should be described the same way across home, app pages, privacy, support, and App Store listings.

AEO Findings

Strong

FAQPage schema is implemented on app pages and support, giving the site a good answer-engine base.

Issue

Many feature headings are poetic rather than question-shaped, so snippets have to infer the question from surrounding text.

Issue

The homepage lacks a concise “Pretty Toolkit is...” definition near the top.

Issue

No tables or comparison blocks exist for app capabilities, privacy posture, offline behavior, or supported formats.

Opportunity

Add short direct-answer paragraphs below question headings and preserve the brand voice around them.

Recommendations Matrix

Timing	Recommendation	Action
--------	----------------	--------

Immediate	Create branded OG image	Add public/og-image.png at 1200x630 and verify previews.
Immediate	Fix analytics wording	Replace absolute “no analytics SDKs” claims with precise privacy-first language matching Mixpanel disclosures.
Next	Add screenshots	Commit screenshots under public/screenshots/<slug>/, serve via picture WebP/PNG, and use descriptive alt text.
Next	Expand schema	Organization: sameAs, contactPoint. Apps: publisher, image, downloadUrl, privacyPolicy, featureList; BreadcrumbList on nested pages.
Next	AEO copy pass	Add question headings and concise answers to home/app/support pages without making the site feel like a help center.
Later	Evidence layer	Once available, add App Store ratings, press links, social profiles, and blog/resources links as crawlable evidence.

Implementation Notes

- In BaseLayout, /og-image.png is the default social image; add the asset or pass page-specific ogImage values.
- In src/layouts/BaseLayout.astro, Organization sameAs is currently an empty array; fill it only when real social URLs are live.
- In src/pages/[slug]/index.astro, SoftwareApplication schema is generic. Avoid emitting free Offer schema for coming-soon apps without a live App Store URL.
- In src/data/apps.ts, app FAQs are strong. Use the same data to shape visible answer sections higher on product pages where appropriate.
- In src/pages/index.astro and about/support copy, align privacy claims with the app-specific policies that disclose Mixpanel anonymous analytics.

Score Rationale

SEO 7.2/10: Strong crawlable foundation, unique metadata, sitemap/robots, and app schema. Deductions for missing OG asset, no screenshots, shallow schema, and external-canonical terms page in sitemap.

GEO 5.8/10: Good brand clarity and privacy-first positioning, but entity authority is thin. Missing sameAs/social profiles, named trust signals, evidence, and consistent privacy claims lower confidence for AI citation systems.

AEO 7.0/10: FAQ schema and long-tail app FAQs are strong. The next lift is converting poetic section copy into explicit question/answer blocks where searchers ask direct questions.
